Introduction

The first regex I learned to work with was Perl, in a workshop offeredby the same organization where I first started to learn about Linux. This was largely a cultural thing, the organization had been around since the 90's, and a lot of the scripts in usage when I got there were still implemented in Perl. However, as I began writing more and more in Python,I started to notice little edge cases where my regex notation wasn't functioning as expected.

Eventually (after much frustration) I started working with a python regex reference pulled up in the background, so I decided to make a more unified reference pocketbook, both for my use, and the use of anyone else wants it. It's a super handy cheat sheet to have on hand for convenience's sake.

Happy hacking, y'all!

Some handy examples

Date in format dd/mm/yyyy:

```
[0-2]$\([0-3]$\([0-6]$\([0-6]$\)\([-1]$\([0-6]$\)\([0-6]$\([0-6]$\)\([0-6]$\)\([0-6]$\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\]\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\]\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\]\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\]\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\([0-6]$\)\

Regex Variants

In this guide, we'll only be covering the Python and Perl Regex variants, but they're actually technically from the same family of regexes. There are two major types of Regular Expression, IEEE Posix compliant, and PCRE

IEEE Posix compliance standards:

- \bullet BRE (Basic Regular Expression):requires the escape of $\{\ \}$ and ()
- the need to escape { } and (), amongst other differences
- SRE (Simple Regular Expression)

Perl and PCRE (Perl Compatible Regular Expressions): Perl's readability and utility have led to Perl Regex variants being adopted by a number of programming languages and utilities, including:

- Java
- · JavaScript
- . -

XML Schema

- Python
- Buby
- 10 ·

Despite being Perl RegEx compatible, most of them have places where they deviate from the core implementation. Let's take a look at a few of the ways that Perl and Python PCRE Regex flavors differ:

Multiplicity

Wat do?	How Perl do?	How Python do?
0 or 1	?	?
0 or 1, non-greedy	??	??
0 or 1, don't give back on backtrack	?+	N/A
0 or more	*	*
0 or more, non-greedy	*?	*?
0 or more, don't give	*+	N/A
back on backtrack		
1 or more	+	+
1 or more, non-greedy	*?	*?
1 or more, don't give back on backtrack	++	N/A
Specific number	$\{n\}$ or $\{n,m\}$ or $\{n,\}$	$\{n\}$ or $\{n,m\}$ or $\{n,\}$
Specific number, non-greedy	{n,m}? or{n,}?	${n,m}$? or ${n,}$?
Specific number, don't give back on backtrack	{n,m}+ or{n,}+	N/A

Other basic regex characters

Wat do?	How Perl do?	How Python do?
Independent non-backtracking pattern	(?⟩)	N/A
Anywhere but word boundary	(?i) or (?-i)	(?i) or (?-i)

Regex is an Algebra

And as such, it requires us to use operators. Every regex has a number of symbols that are interpreted as metacharacters, and as such, if you want to search for them via regexes, they will need to be escaped. these are:

These symbols are the building blocks of any regular expression you build, and so will not be interpreted as literal characters.

We'll see more of these symbols as we start to look more the details of Python and Perl regexes, we'll go into what they actually do momentarily, the important thing for now is to grok is that, if regex is an algrebra, these symbols are the operators we use to relate all other characters.

Basic Symbols

Wat do?	How Perl do?	How Python do?
Custom character	[]	[]
class		
Negated custom	[^]	[^]
character class		
Ranges	[a-z] (with '-' escaped if it comes last)	[a-z] (with '-' escaped if it comes last)
Alternation ("or")		

Moar Character Classes

A/N	[[:ascii:]]	ASCII character
		срагастег
A/N	[[:ˈwnu ɐ:]]	Any alphanumerical
		срагастег
A/N	[[:slpha:]]	Any alphabetical
		"word" characters
		character excluding
∀/N	[[:bnuct:]]	Any graphical
A/N	A/N	Any octal digit
A/N	[[:tigibx:]]	Any hexadecimal digit
		срагастег
a\	α/	Match a non-digit
		срагастег
p\	/d or [[:digit:]]	Match a digit
How Python do?	How Perl do?	Sob tsW

Lookarounds

(!)	(?\(\;'')	Megative lookbehind
(=>?)	(::=>?)	Positive lookbehind
()	(%)	Negative lookahead
(=?)	(=?)	Positive lookahead
How Python do?	How Perl do?	Sob tsW

Lookaheads assert that the character or series of characters following the current position can be represented by the given expression is represented by '...'), while lookbehinds assert that the expression is representative of the character immediately preceeding the current position.

Positive lookarounds suggest the presence of a match, while negative lookarounds assert the absence of an expression match.

Zero-width assertions

Z\ / \$	Z\ / \$	End of line/string
		line/string
A/\^	A/\^	Beginning of
		ponugsty
8/	8/	Anywhere but word
q\	q\	Word boundary
How Python do?	How Perl do?	Sob tsW

Captures and Groups

(?P=name)	/k <name></name>	Named backreference
		specific group
L \	ι 6\ ' ι \	Backreference to a
(:۶)	(:۶)	Non-capturing group
(< or (?P <name>)</name>	(\ or (?\name\))	Capturing group
How Python do?	How Perl do?	Sob tsW

Character Classes

		cysracter
		·
		non-whitespace
8/	S/	Match a
		(ənilwən
\$∖	/e ot [[:sbace:]]	Whitespace (including
		including newlines)
A/N	A/N	Whitespace (not
		including newlines)
A/N	A/N	Mhitespace (not
A/N	[[:nbbek:]] ok [[:lowek:]]	Оаѕе
		character
w/	/w or [[:word:]]	Match a "word"
		срагастег
M \	M\	Match a non-"word"
		(ənilwən
•	•	Any character (except
How Python do?	How Perl do?	Yat do?
